

Abstract of the Disclosure

A network-based system is provided for enabling agent-users of the
5 system to obtain current client-status information related to clients of an
information-source facility connected to the network in order to optimize
callback-connection success from the agent-users to the monitored clients.
The system comprises, a first server node connected to the information-
source facility and to the network, a second server node connected to the
10 first server node and to the network, the second server node accessible to
the first server node, a network-capable appliance connected to the network,
the second server node accessible to the network-capable appliance, an agent
workstation connected to the network and to the first server node, the first
server node accessible to the agent workstation and a software application
15 distributed on at least the first and second server nodes, the software
application enabling distribution of the client-status information. The agent-
user operating the agent workstation accesses the first server node and
subscribes to the client-status information, the client-status information is
accessed from the second server node by the first server node and delivered
20 to the requesting agent-user.
